Claims Processing Optimization

Online Claims Pre-Submission Validation Initiative

US-01 Check codes match before claim is submitted [Priority: High]

As a General Practice provider submitting a claim online, I want the system to check that my procedure code matches my diagnosis code before I submit, so that I don't get denied for a preventable mismatch.

Acceptance Criteria:

1. Given I am on the online claim submission form, When I enter a diagnosis code and a procedure code, Then the system shall validate the pairing against the specialty-specific reference table before allowing submission.
2. Given the code pairing is valid, When I click Submit, Then the claim shall be accepted and routed to standard processing.
3. Given the code pairing is invalid, When I click Submit, Then the claim shall be blocked from submission and an inline error shall be displayed.

US-02 Show provider exactly what to fix [Priority: High]

As a provider whose claim fails validation, I want a clear, specific error message, so that I know exactly what to correct without contacting support.

Acceptance Criteria:

4. Given a validation failure occurs, When the error is displayed, Then it shall name the specific field (diagnosis code or procedure code) causing the failure.
5. Given a validation failure occurs, When the error is displayed, Then it shall suggest at least one valid procedure code for the entered diagnosis, where available.
6. Given I correct the flagged field, When I resubmit, Then the form shall re-validate without requiring me to re-enter unrelated fields.

US-03 Turn on the new check only for General Practice [Priority: Medium]

As a Product Owner, I want validation rules to apply only to General Practice claims at launch, so that other specialties are unaffected during the initial rollout.

Acceptance Criteria:

7. Given a claim is submitted with ProviderSpecialty = General Practice, When the form is submitted online, Then the new validation rule shall be applied.
8. Given a claim is submitted with any other specialty, When the form is submitted online, Then the existing (unchanged) submission flow shall apply.
9. Given the Phase 2 rollout is enabled for a new specialty, When that specialty's claims are submitted, Then the corresponding specialty-specific rule set shall be applied.

US-04 Let provider fix and resubmit without starting over [Priority: Medium]

As a provider correcting a flagged claim, I want my previously entered information preserved, so that I don't have to redo the entire submission.

Acceptance Criteria:

10. Given a claim submission is blocked by validation, When the error is shown, Then all previously entered field values shall remain populated on the form.
11. Given I correct only the flagged field, When I resubmit, Then the system shall not require re-entry of patient, provider, or claim-amount fields.
12. Given the corrected claim passes validation, When I resubmit, Then a new submission timestamp shall be recorded for SLA tracking.

US-05 Record every rejected claim for review [Priority: Medium]

As a Claims Operations analyst, I want every validation failure logged with specialty, channel, and reason, so that I can analyze denial patterns over time.

Acceptance Criteria:

1. Given a validation failure occurs, When it is logged, Then the log entry shall include specialty, submission channel, diagnosis code, procedure code, and timestamp.
2. Given a claim is later corrected and successfully submitted, When it is logged, Then the log shall link the successful submission to its prior failure record.
3. Given logs exist for a given month, When queried, Then they shall be exportable in a format compatible with the existing Power BI / SQL reporting pipeline.

US-06 Send a monthly denial trends report [Priority: Low]

As a Product Lead, I want an automated monthly report of denial rates by specialty and channel, so that I can identify the next highest-risk pattern to address.

Acceptance Criteria:

4. Given a calendar month completes, When the report job runs, Then a report shall be generated showing denial rate broken down by specialty and submission channel.
5. Given the report is generated, When it is distributed, Then it shall be automatically sent to Claims Operations and Product distribution lists.
6. Given a specialty/channel combination exceeds the 33.6% portfolio-average denial rate, When the report is generated, Then that combination shall be visually flagged for review.

US-07 Keep the claim form fast after adding checks [Priority: Medium]

As a Product Owner, I want validation to add minimal latency to the submission process, so that provider experience doesn't degrade because of the new checks.

Acceptance Criteria:

7. Given a provider submits a claim online, When validation runs, Then the added processing time shall not exceed 15 seconds versus the pre-release baseline.
8. Given the validation service is unavailable, When a provider submits a claim, Then the system shall fail gracefully and route the claim to manual review rather than blocking submission indefinitely.
9. Given performance is measured post-release, When compared to baseline, Then results shall be reported in the UAT sign-off summary.
